The *South Georgia Business Outlook* is a quarterly publication that examines the economic conditions and events that influence the South Georgia business environment. The purpose is to provide information about regional economic activity and a forecast of expected future economic activity. Although each issue will include the outlook for the state of Georgia, the primary focus is on the thirty-two counties that comprise the South Georgia region.

The *South Georgia Business Outlook* is sponsored by the Center for Business and Economic Research and the Langdale College of Business.

**Economic Outlook: 1st Quarter 2009**

Challenges continued during the first quarter of 2009 as the United States economy moved deeper into recession. While household expenditures increased modestly, business investment declined by nearly 37% with commercial and residential real estate, and software and equipment leading the business investment contraction. International demand for U.S. goods and services declined by nearly 30% as U.S. trade partners also experience recessionary pressures.

Given the weakness in the goods and services market and declining production, the unemployment rate increased to 8.9% during April 2009, a level last seen during October 1983. The U.S. labor market for all industries experienced a net loss of jobs. As goods and services production declined by an annualized rate of 5.7% during the first quarter, layoffs continued at a pace of over 600,000 workers per month, matching the pace of the previous five months.

As measured by the consumer price index, the U.S. economy continued to experience deflationary pressures. Over the fourth quarter 2008 and first quarter 2009, prices declined at an average annual rate of 3.6%. Deflationary pressures however are likely to be short lived as the Federal Reserve System’s historically easy monetary policy is likely to lead to rapid increases in prices as the economy recovers from the recession.

Since September 2008, the federal government and the Federal Reserve System have taken extraordinary actions to reverse the recessionary pressures. Although it appears that these actions are moderating the recession in the short-run, these actions will likely have long-run negative consequences on sustainable economic growth and inflation.

Federal government intervention in the form of loans and in some cases ownership on private sector businesses has increased significantly since September 2008. Beginning with the intervention in the financial markets during October 2008, government influence over private sector decisions expanded to the automobile industry by January 2009, and is likely to expand to the health care and health care related industries.
by the end of 2009. While government is necessary to set the rules and regulations for the economy and encourage and at times provide under-produced goods and services, empirical evidence suggests that government intervention in markets often leads to less efficient outcomes and the misallocation of resources. The long-run consequences of prolonged government intervention are therefore a lower average growth rate and slower net job growth.

The federal government is relying upon issuing debt to pay for the increased spending. Since the private sector has not been willing to purchase all of the debt, the Federal Reserve System has increased its purchases of the debt. Monetarizing the debt coupled with the extraordinary easy monetary policy will lead to rising inflation and higher long-term interest rates.

Economic indicators suggest that the recession is moderating and although economic growth may turn positive before the end of 2009, the strength of the recovery will be weak and job growth is unlikely to return until the first half of 2010. The state of Georgia is likely to follow the national trend with some parts of the South Georgia region recovering sooner than the rest of the economy. Counties that rely upon manufacturing jobs however will likely recover at a pace slower than the national average.

**Georgia**

Job losses for the state of Georgia increased pace through April 2009. The number of unemployed exceeded 400,000 workers during the first months of 2009 with the number of unemployed reaching 435,512 during March 2009. During the first quarter of 2009, major employers such as Shaw Industries, Pilgrim’s Pride, Rheem Manufacturing, Aramark Facilities Services and Cooper Tire & Rubber Company announced layoffs and closures. Other companies across the state announced furloughs as a means of adjusting labor force costs.

Except for Education and Health Services, net job losses increased across all industries in the state of Georgia. The year-to-year job losses were 185,900 through March 2009. With state and local budget cuts and hiring freezes in place, net jobs for education are likely to contract before the end of 2009. Health care and health care related jobs will also likely decline as Congress potentially reforms the United States health care system.

Manufacturing continued to experience the largest net job losses with year-to-year job losses of 47,500. Plant closings throughout the state have reduced durable goods manufacturing by 30,700 jobs and non-durable goods manufacturing by 16,800 jobs. Textile and textile related and transportation equipment manufacturers lead the contraction through the first quarter of 2009. This trend is likely to continue into 2010 as the U.S. textile and automotive industries continue to restructure.

Educational and Health Services reported the only industry net job gains for the year-to-year comparison. Net job losses for education however are likely by year’s end as state and local governments cut the budgets of
School systems and institutions of higher education across the state have announced hiring freezes and furlough discussions have increased.

The rising number of unemployed coupled with the contracting size of the labor force has lead to a rise of the unemployment rate to 9.1%. The forecast predicts that job losses for the state of Georgia are likely to continue through the end of 2009. Although job creation may pick up in several sectors during the first quarter of 2010 as the recovery begins to take hold, labor force expansion will keep the unemployment rate above 8% through the first half of 2010. Market uncertainty, volatile energy prices, and rising interest rates will be a drag on the Georgia economy through the first half of 2010.

South Georgia

The South Georgia region comprises thirty-two counties that are divided into three regions based upon the Georgia Regional Development Center designations. The Southwest Georgia and South Central Georgia regions include a metropolitan statistical area (MSA) as defined by the United States Office of Management and Budget. The Albany-MSA is located in the Southwest Georgia region and the Valdosta-MSA is located in the South Central Georgia region.

Following the state of Georgia trends, the South Georgia region is in a recession. The unemployment rate in the Southeast and South Central regions reached 10% during February 2009 with the Southeast region reaching nearly 11%. Although the unemployment rate rise is in part due to plant closures and employment freezes across the region, an expanding labor force also contributed to the increase. While the unemployment rate is expected to remain above the natural rate throughout 2010, it is
expected that the unemployment rates across South Georgia will moderate as production growth returns by the end of 2009 and net job gains return by the beginning of 2010.

South Central Georgia Region

The South Central Georgia region continues the effects of the recession. Closures and layoffs by companies such as Fugifilm, Centrapak, Commissary Operations Incorporated, Hood Packaging Corporation and Shaw Industries have lead to a doubling of the number of unemployed in the region since October 2008. Job losses that began around the beginning of 2008 continued through the first quarter of 2009.

The unemployment rate for the South Central Georgia region has risen from 4.6% during October 2008 to 9.2% during March 2009. The unemployment rate however does not reflect the full impact of the recession since furloughs and reduced work hours that many workers are experiencing are not included in the unemployment rate.

The South Central Georgia region forecast suggests that unemployment will remain above 9.0% until the fall 2009. While the forecast predicts that the economy will begin recovering by the fourth quarter of 2009, cyclical unemployment is expected to remain positive through most of 2010.
**Valdosta-MSA**

Employment in the Valdosta-MSA continued to decline through the first quarter of 2009. The number of non-agricultural jobs has declined to 55,800. Although service sector jobs increased, the year-to-year net job losses were driven by the decline in manufacturing jobs within the Valdosta-MSA. If the economy recovers more slowly than expected, the net job losses may increase further as companies move from furloughs to layoffs and hiring freezes.

Despite low mortgage rates, the real estate, and construction and construction related jobs remain weak for the Valdosta-MSA. After averaging $3.6 million since September 2008, housing permits rose slighting in April 2008 to $4.7 million. It is too early to declare the new construction market is in recovery for the Valdosta-MSA however it does appear that it has reached a trough.

Area businesses under the leadership of the Valdosta-Lowndes County Chamber of Commerce are supporting an expanded chamber initiative, Think B.I.G - Buy In Greater Valdosta. The Chamber and its members have set a goal of redirecting $5 million worth of business expenditures back into the Greater Valdosta area. If this goal is achieved, the Valdosta-MSA will recover 20% of the net job losses experienced since September 2008.

The forecast predicts that the Valdosta-MSA unemployment rate will remain above the natural rate with positive cyclical unemployment through the middle of 2010. The forecast predicts that the Valdosta-MSA will enter a recovery phase before the end of 2008; however since the labor market tends to
lag production changes, cyclical unemployment will remain positive through the first half of 2010. The forecast predicts an average unemployment for the Valdosta-MSA above 7.0% for the remainder of 2009 before dropping below 7.0% during the first half of 2008.

Southwest Georgia Region

Job losses continued throughout most of 2008 and across all industries in the Southwest Georgia region. Labor market weakness and slow growth has plagued the region for more than two years. Plant closures and layoffs by companies such as American Fibers & Yarns Company, ABB Incorporated, XLC Services, Traco and Cooper Tire & Rubber Company have lead to a further deterioration of employment within the Southwest Georgia region.

The Southwest Georgia region unemployment rate rose to 8.6% however it is the only region in South Georgia that remains below the state average unemployment rate of 9.2%. It is likely seasonal labor force expansion during the summer months will lead to a rise of the unemployment rate through September 2009. As the recession moderates and seasonal unemployment subsides, the Southwest Georgia region unemployment rate should improve by the end of 2009. With the structural changes in the labor market resulting from recent federal government policy changes along with the plant closures of textile and automotive-related companies, it is not likely that manufacturing jobs lost during this recession will return once the recovery begins. Structural changes to the labor market, volatile energy prices and expected higher interest rates will likely slow the pace of recovery in this region. Cyclical unemployment is expected to remain positive through the first half of 2010.

Albany-MSA

For the Albany-MSA, employment losses were experienced across all industries. Non-agricultural jobs declined by 2,500 to a total employment of 62,200, a level of employment last experienced during 2004. With additional plant closures announced, expected rising interest rates and government budget cuts, it is expected that job losses will continue through the end of 2009 and the first half of 2010.
Real estate, construction and construction related jobs remained weak during the first quarter of 2009. Since November 2008, housing permits have averaged around $1.0 million per month, insufficient to sustain viable construction and construction-related industries.

Despite plant closures and layoffs with the Greater Albany area, at 8.1% the Albany-MSA unemployment rate is below the average unemployment rate for the Southwest Georgia region. The forecast predicts that seasonal labor market movements will increase the Albany-MSA unemployment rate through the end of September 2009. Seasonal and cyclical unemployment should moderate during the last quarter of 2009 leading to a slight decline by the first quarter of 2010.

**Southeast Georgia Region**

The Southeast Georgia region continued to experience a net job loss through the first quarter of 2009. Job closures and layoffs by companies such as West Fraser Incorporated, Pilgrim’s Pride and Julie Hat Company Incorporated have lead to a further decline in employment for the region. With a heavy reliance upon jobs in the manufacturing, wood products, and agricultural and forestry production sectors, this region has experienced employment losses for more than two years.

The unemployment rate for the region has nearly doubled over the last year, rising from 5.5% during March 2008 to 10.5% during March 2009. Given the labor force and industry structure for the region, and the loss of manufacturing jobs, the higher than state average unemployment rate is likely to continue into the future. Only a change in economic development through aggressive business recruitment and local business expansion initiatives will position the region to take advantage of the national economic recovery that is expected to begin during 2010. Without these changes, the average unemployment rate for the region will be permanent higher than the state and national averages. The forecast predicts that cyclical unemployment will remain positive through the first quarter of 2010 leading to an unemployment rate that exceeds 10.0%.

This region does not include a MSA.
The Center for Business and Economic Research supports regional development and promotes activities that strengthen the competitive positions of regional business. In addition to conducting applied research on important regional issues, The Center for Business and Economic Research’s members and associates provide a broad range of consulting services, training programs, and public service activities to area organizations. Visit [http://www.valdosta.edu/lcoba/cber.shtml](http://www.valdosta.edu/lcoba/cber.shtml) for a listing of available services or contact the Director of the Center for Business and Economic Research, Dr. Cliff Lipscomb at 229-245-3774.

The South Georgia Business Outlook is a quarterly publication of the Center for Business and Economic Research, Langdale College of Business, Valdosta State University. The articles reflect the opinions of the author, but not necessarily those of the staff of the Institute, the faculty of the Langdale College of Business, or the administration of Valdosta State University.

Dr. Cynthia Royal Tori is an Associate Professor of Economics at the Langdale College of Business and regional economic forecaster for the Center for Business and Economic Research. Dr. Tori has a Ph.D. in Economics from the University of Kentucky and has been a member of the Langdale College faculty since August 1998. You may contact Dr. Tori by email at crtori@valdosta.edu.
